

SparkFun Inventor's Kit — Mobile Station #4

The image above displays the components included in the SparkFun Inventor's Kit. The kit allows users to construct a variety of circuits that use an Arduino Uno to read sensors, display information on an LCD, drive motors, and more. No previous programming or electronics experience is necessary. The kit will need to be connected to a laptop, which serves as both an interface and a power supply. These devices are not generally set out throughout the entire day. The library should set up the mobile station for specific hours during the week and check it out for in-library use.
